Search Notes

Dear Examiner Morgan:

Please find attached the results of your search for the above-referenced case. The search was conducted using the Business Methods Template Databases on Dialog, ProQuest, and EBSCOHost.

I have listed *potential* references of interest in the first part of the search results. However, please be sure to scan through the entire report. There may be additional references that you might find useful.

If you have any questions about the search, or need a refocus, please do not hesitate to contact me.

Thank you for using the EIC, and we look forward to your next search!

Note: EIC-Searcher identified "potential references of interest" are selected based upon their apparent relevance to the terms/concepts provided in the examiner's search request.

Patient interface system for **remote** monitoring system has communication unit which transfers processed data output from processor to remote monitoring systems and receives instructional data from remote system

Alerting Abstract ...that inactivates the patient interface system, if the sensor measures weight below or above preset weight. A processor receives and stores data from patient data **input unit**. The communication **unit** transfers the processed data to remote monitoring system from where instructional data are received....physiological parameter with preset target value and questions for determining variance. An INDEPENDENT CLAIM is also included for method for collecting and transferring data from **patient** to **remote** monitoring system...

...USE - For collection and transferring data from **patient** to **remote** monitoring system for use in monitoring chronic diseases like diabetes, respiratory disease, cardiac disease, AIDS and other viral conditions also associated with use of immunosuppressants...

...DESCRIPTION OF DRAWINGS - The figure shows schema of **patient** interface system and its use in **remote** monitoring of **patient** with cardiac associated disease.

Detailed Description

Detailed Description

... Kirk et al. on February
14, 1995 discloses a home healthcare and communication support
system. The system includes a health support unit located in the
patient's home for monitoring and supporting a patient.
The
health support unit is networked to a remote monitoring terminal
for continuous remote monitoring of the patient. The health
support unit includes a medication controller for measuring
the
patient's medicine compliance and a communications module for
communicating with an operator at the monitoring terminal. The
health support is further networked to the patient's healthcare
provider to allow the healthcare...

Assignee name & address:

Original Abstracts:

...as core temperature, ECG electrodes for providing an electrocardiogram and blood oximetry sensors. The patient monitor is small and compact and easily worn by the **patient** during his normal at **home** activities. To provide communication with a caregiver via a remote **controller** at the caregiver's location, a communications **unit** is disposed in the facility. The communications unit may be selectively coupled to the programmable patient monitor for receiving, storing and transmitting to the **remote** controller **patient** physiological condition data and for transmitting instructions from the **remote controller** to the programmable **patient** monitor. When the patient connects the patient monitor to the communications unit, the patient can communicate with the caregiver at the remote location.

Claims:

...physiological condition data representative thereof and being

electrically coupled to the programmable patient monitor; and a communications unit disposed in the facility for communicating with a remote controller, and selectively coupled to the programmable patient monitor for receiving, storing and transmitting to the remote controller patient physiological condition data and for transmitting instructions from the remote controller to the programmable patient monitor; wherein the programmable patient monitor monitors the recorded physiological condition data in accordance with a stored instruction comprising a predetermined range of values and generates a patient alarm signal in response to a monitored physiological condition data being outside the predetermined range; wherein the alarm signal is resettable only upon receipt of a new instruction from the remote controller; wherein the programmable patient monitor monitors operation of the plurality of patient monitoring sensors within a predetermined set of operational values and generates an alert signal in response to a detected operation outside the predetermined set; wherein the alert signal is resettable upon the...

...monitor and manage a health condition of a patient. The system includes a health care provider apparatus operated by a health care provider and a **remotely** programmable **patient** apparatus that is operated by a patient. The health care provider develops a script program using the health care provider apparatus and then sends the script program to a **remotely** programmable **patient** apparatus through a communication network such as the World Wide Web. The script program is a computer-executable patient protocol that provides information to the...

...health condition by asking the patient questions and by receiving answers to those questions. The answers to these health related questions are then forwarded as **patient** data from the **remotely** programmable **patient** apparatus to the health care provider apparatus through the communication network. The patient data may also include information supplied by a physiological monitoring device such as a blood glucose monitor that is connected to the **remotely** programmable **patient** apparatus. When the **patient** data arrives at the health care provider apparatus, the patient data is processed for further management of the patient's health condition by the health care provider, such as forwarding another script program to the **remotely** programmable **patient** apparatus.

Claims:

...to the health care provider, the health care provider apparatus, comprising:i). a health care provider interaction unit having:A). a health care provider interaction **unit** display that is **controlled** by a health care provider interaction **unit** interface, the health care provider interaction unit interface accepting a health care provider display information and rendering the health care provider display information for display on the health care provider interaction unit display;B). a health care provider interaction **unit** **input** device that receives a health care provider **input** from the health care provider, the health care provider interaction **unit** **input** device sending the health care provider **input** to the health care provider interaction interface;ii). a health care provider data management unit, comprising:A). a health care provider central processing unit having...

...program having script commands representing a computer-executable patient protocol for the management and monitoring of the patient's health condition;c). providing a remotely-programmable **patient** apparatus to the **patient**, the **remotely**-programmable **patient** apparatus, comprising:i). a **patient** interaction unit having:A). a patient interaction **unit** display that is **controlled** by a patient interaction **unit** interface, the patient interaction unit interface accepting a patient display information and

rendering the patient display information for display on the patient interaction unit display;B). a patient interaction unit input device that receives a patient data from the patient, the patient interaction unit input device sending the patient data to the patient interaction unit interface;ii). a patient data management unit, comprising:A). a patient central processing unit having a ...

...processing unit;d). connecting the health care provider apparatus to the communication network by way of the health care provider communication means;e). connecting the remotely programmable patient apparatus to the communication network by way of the patient communication means;f). downloading the script program from the health care provider apparatus to the remotely programmable patient apparatus over the communication network;g). processing the script program with the patient central processing means of the remotely programmable patient apparatus, the processing of the script program producing the patient display information;h). displaying the patient display information to the patient on the patient interaction...

...SPECIFICATION module 18 even though it may not be always powered. If the trailer 14 is a refrigerated trailer, power will be available from the refrigerated **unit**.

An information and power **input module** is located at the rear of the trailer 14 and communicates with the trailer identification module 18. Information regarding the manifest or cargo to be carried by the trailer 14 can be input via this **communication linkage** which is connected to the RS485 driver 152 of the trailer identification module 18.

A theft prevention function is built in to the trailer identification

...ABSTRACT devices for the units and apparatus of the engineering equipment in the building. This system further includes controllers connected in a "star" circuit to the **input-output device** of the **central computer** module. Each **controller** has a plurality of remote **input-output modules** connected serially thereto, while each of said modules has a corresponding sensor or a **control device** connected thereto. At least one additional computer station is connected through its **input-output module** to the corresponding controller that ensures, according to the software, the local monitoring and the control of the units and apparatus in at least one...

NOTE:

...SPECIFICATION devices for the units and apparatus of the engineering equipment in the building. This system further includes controllers connected in a star circuit to the **input-output device** of the **central computer** module. Each **controller** has a plurality of remote **input-output modules** serially connected thereto, while each of said modules is linked to a corresponding monitoring and/or measuring and/or control sensor and/or **device** for **controlling** a specific unit or apparatus of the engineering equipment in the building. There is also at least one additional computer station connected through its **input-output module** to the corresponding controller to ensure, according to the software, the local monitoring and the control of the units and apparatus in at least one...

...are inter-related with one another, and form a stable combination of material features sufficient to obtain the requisite engineering result.

Thus, connection of the **controllers** to the **input-output device** of the **central computer** module in a hierarchical star circuit makes it possible, even with the use of cable sections of a limited length, to ensure a constancy of signal parameters during the transmission thereof over these sections while preserving the scheme of **communication** between the central **module** and the remote **input-output modules** to which the sensors and control devices are connected. It also becomes possible to place each such controller in the communications hub on a separate...

...the object of automation can be effected with the use of a computer mouse, a functional keyboard or a standard keyboard, or from a special control board.

The input-output device 2 of the central computer module has a plurality of controllers 5 connected thereto in a hierarchical-star (bus-star) circuit or in a bus (a bus-group) circuit. The...

...to support the process of data exchange and conversion of data from one protocol to another protocol. Each of the controllers has a plurality of remote input-output modules 6 connected thereto in a hierarchical-star circuit, while each of said modules is further connected to a corresponding monitoring and/or measuring and/or...

...SPECIFICATION system and units for off-line control of the engineering equipment, and further connected in a hierarchical-star circuit or a bus circuit to the input-output device of the central computer module, each of said controllers having a plurality of remote input-output modules connected serially or in above-mentioned star circuit thereto, while each of said remote input-output modules is further connected to a corresponding monitoring and/or measuring and/or control sensor and/or control device for a specific unit or apparatus of the engineering equipment in the building connected thereto.

Description of the Prior Art

Traditional solutions presuppose automation of local engineering systems of...

...devices for the units and apparatus of the engineering equipment in the building. This system further includes controllers connected in a star circuit to the input-output device of the central computer module. Each controller has a plurality of remote input-output modules serially connected thereto, while each of said modules is linked to a corresponding monitoring and/or measuring and/or control sensor and/or device for controlling a specific unit or apparatus of the engineering equipment in the building. There is also at least one additional computer station connected through its input-output module to the corresponding controller to ensure, according to the software, the local monitoring and the control of the units and apparatus in at least one...

...are inter-related with one another, and form a stable combination of material features sufficient to obtain the requisite engineering result.

Thus, connection of the controllers to the input-output device of the central computer module in a hierarchical star circuit makes it possible, even with the use of cable sections of a limited length, to ensure a constancy of signal parameters during the transmission thereof over these sections while preserving the scheme of communication between the central module and the remote input-output modules to which the sensors and control devices are connected. It also becomes possible to place each such controller in the communications hub on a separate...

...the object of automation can be effected with the use of a computer mouse, a functional keyboard or a standard keyboard, or from a special

control board.

The input-output device 2 of the central computer module has a plurality of controllers 5 connected thereto in a hierarchical-star (bus-star) circuit or in a bus (a bus-group) circuit. The...

...support the process of data exchange and conversion of data from one protocol to another protocol. Each of the controllers has a plurality of remote input-output modules 6 connected thereto in a hierarchical-star circuit, while each of said modules is further connected to a corresponding monitoring and/or measuring and/or...

...CLAIMS units for off-line control of the engineering equipment, with the controllers further connected in a hierarchical-star circuit or a bus circuit to the input-output device of the central computer module, each of said controllers having a plurality of remote input-output modules connected serially or in above-mentioned star circuit thereto, while each of said modules has a corresponding monitoring and/or measuring and/or control sensor and/or control device for a specific unit or apparatus of the engineering equipment in the building connected thereto, and in that it includes at least one additional computer station linked through its input-output module via the local area network with the central computer module and, via a dedicated channel, with the corresponding controller that ensures, according to the software, the local monitoring and the control of the units...

...CLAIMS for off-line control of the engineering equipment, with the controllers (5) further connected in a hierarchical-star circuit or a bus circuit to the input-output device (2) of the central computer module (1), each of said controllers (5) having a plurality of remote input-output modules (6) connected serially or in above-mentioned star circuit thereto, while each of said remote input-output modules (6) is further connected to a corresponding monitoring (10) and/or measuring (11) and/or control (12) sensor and/or control device (13) for a specific unit or apparatus of the engineering equipment in the building connected thereto,

characterized in that

it includes at least one additional computer station (15) linked through its input-output module via the local area network (16) with the central computer module (1) and, via a dedicated channel, with the corresponding controller (5) that ensures, according to the software, the local monitoring and the control of...

...section of the engineering equipment in the building.

2. A system according to claim 1, characterized in that each controller has a plurality of remote input-output modules (6) connected thereto, the modules (6) being linked to said sensors (10, 11, 12) or control devices (13) for the units and apparatus in at...

...SPECIFICATION controller for controlling just the processor 21 as will be detailed below.

The first and second controllers 210 and 220 are connected together by a **communication** link 230. Each controller 210 and 220 includes an **input** output **communication** interface **module** 240 and 250, a microprocessor 260 and 270 and a memory module 280 and 290 respectively. In the case of controller 210 a number of other control system modules interface with the microprocessor 260 including an **exposure unit controller** 300, a plate transport **controller** 310 and a plate handler controller 320. In the case of the plate processor controller 220, it includes a plate transport controller 330, and a...

...SPECIFICATION displayed is stored in a memory unit 62. Control unit 60 addresses this data via an address bus 64. The addressed is provided to control unit 60 via a data bus 66. Control unit 60 and memory 62 are located in the stationary unit.

The mobile unit includes, for each array 10, a corresponding control module 40. Control module 40 includes a pulse selector 42, a counter 44, a flip flop 46, a shift register 48 and a register driver 50.

Communication links between control modules 40 and control unit 60, symbolized in Figure 2 by the vertical lines and the vertical double arrow that connect control unit 60 and control module 40, are provided as taught by Lock and by Belcher et al. For clarity, only one control module 40 is shown in Figure 2...

...ABSTRACT to the reservoir (1) by a pump (3) and a metering system (6). A processor (12) fitted to the metering system is linked to a **central computer** (13) by a data bus to give information on the amount of fuel dispensed and the type of fuel.

The separate dispensing points are fitted with **display modules** (15) which indicate the amount and value of the fuel dispensed as well as the type of fuel selected and the unit price. These modules are **controlled** from the **central computer** by the data bus. The dispensing point also has a fuel vapour return line (8) from the dispensing gun. This returns fuel vapour to the...

...SPECIFICATION Beckner et al. on May 27, 1986. Such a switching system can be a 5ESS(R) switch, described in AT&T Technical Journal, Vol. 64, No. 6, part 2, pp. 1305-1564, July/August 1985, and manufactured by Lucent Technologies Inc. The architecture of such a switching system includes a **communication module 4** forming a hub and having a plurality of switch **modules 6**, and an administration module 8 emanating therefrom via **communication links 3**. Each switch module 6 is controlled by processor 7 and provides call processing, time division switching, and signaling for the lines and trunks to...

...it is connected. Line units 10 provide interface to customer lines 11 that connect to the customer premise equipment 13 and trunk units 12 provide **interface** to the trunks 15 that connect the other elements of the public switched network 17 such as other switching systems. Finally, circuit units 14 provide tones, announcements, recorded messages, tone decoding and the like. The line units, trunk units and circuit units are connected to microprocessors 7 via **communication links 9**. The administration module 8 provides functions that can be centralized such as maintenance control, craft interface, text and data base management, call routing and...

...SPECIFICATION block diagram of a control device for a ventilator according to the invention. In this block diagram numeral 1 indicates a processor module including a **control unit** 2 and a memory 3. A high-voltage AC source 4 is connected to processor module 1, which connects said voltage source to ventilator 5. The **control unit** furthermore receives high-voltage current from voltage source 4 after said voltage has been converted by suitable means into low-voltage direct current. Furthermore a **communication link** 12 is connected to processor module 1, which **communication link** connects processor **module** 1 to a central processing unit 6. Also a temperature sensor 7, a potentiometer 8 and a sensor 9 for measuring the air flow through...

...ventilator are connected to processor module 1. The operation of the device is as follows: During normal operation ventilator 5 is controlled by means of **control** signals from the central processing **unit** 6, which signals are supplied to processor module 1 via **communication link** 12. Processor **module** 1 will cause ventilator 5 to operate at a particular desired rotational speed on the basis of said control signals. Temperature sensor 7 thereby measures...

...SPECIFICATION is conveyed to an associated output access control module.

The output access control module is electrically connected to an associated output device which is ultimately **controlled** by the associated operator interface **device** at the **control** panel.

This mode of operation is herein defined as the STAND-ALONE-MODE or PEER-TO-PEER mode where one contact block and its associated input access module sends a signal directly to its associated output access module for **controlling** the associated output **device**. This system could also be used in a HOST mode where the signal from the **input** access **module** is sent to a computer or other device having a CPU or means for adding simple logic functions such as AND, NAND, OR or NOR to the signal. A control system employing a time division multiplex common **communication link** is shown and described in U.S. Patent

4,808,994 issued on February 28, 1989 to Riley for "Logic Interchange System" and in the Patent Application WO 95 04411 assigned to the assignee of the present invention. In this type of system, both the **input** and output access **modules** contain a communications circuit for communicating on the time division multiplexed common communications link and a circuit for implementing basic logic functions

such as AND...

...SPECIFICATION located remotely with respect to the overload relay 6, with the length of the remote connection 36 being longer than the length of the serial **communication link** 12, although shorter lengths are possible.

The **control** source 18 includes a remote **control device** 38 having a **communication module** (COM MOD) 40 which sources remote serial control messages 42 including a remote start message 44 for contactor 1, a remote start message 45 for contactor 2 and a remote stop message 46 for the contactors 1,2 to a serial **communication link** 47. Typically, the remote **control device** 38 is located remotely with respect to the overload relay 6, with the length of the serial **communication link** 47 being longer than the length of the serial communication link 12, although shorter lengths are possible.

The exemplary electrical contactors 1,2 include separable...

...60 convert microcomputer digital outputs 68,70 to suitable signals for energizing and controlling the coils 52,54, respectively. The interface 62 interfaces the serial **communication link** 12 and provides a mechanism for inputting the local serial control messages 24 from the pushbutton station 8 to the microcomputer 56. The interface 64...

...provides a mechanism for inputting the remote control signals 34,35 to corresponding digital inputs 72 of the microcomputer 56. The interface 66

interfaces a **communication module** (COM MOD) 74 with the microcomputer 56. In turn, the **communication module** 74 interfaces the serial **communication link** 47 from the remote **communication module** 40 and provides a local communication mechanism for inputting the remote serial control messages 42 to the interface 66 and the microcomputer 56.

The exemplary...

...SPECIFICATION area network adaptive circuit may operate in a token ring protocol or an ethernet protocol.

US-A-5307463 discloses a module for interfacing a programmable **controller** to a remote **device** using a **communication link**. The interface **module** searches incoming messages for defined sequences of data which enables the messages to be directed without requiring the intervention of the programmable controller.

According to...

...CLAIMS Device according to any of the preceding claims, characterized in that the transmission channel (20) is in the form of a field bus, and the **communications modules** (18) are designed as field bus nodes of a field bus system with a CAN (Controller Area Network) field bus protocol.

4. **Device** according to any of the preceding claims , characterized in that all users (1, 15, 10) connected to the transmission channel (20) may be detected, at least via the **communications module** (18) assigned to the **central computer** (19), by a detection sub-program in the **central computer**.
5. Device according to any of the preceding claims, characterized in that an automatic self-diagnosis may be executed by a self-diagnosis program in the **central computer** (19), at least when running up, via the bus system comprising the **communications module** (18) and the transmission channel (20).
6. Device according to any of the preceding claims, characterized in that a send access of a **communications module** (18) on a transmission channel (20) comprises as start sequence a priority sequence which, in the event of a conflict with priority sequences of other **communications modules** (18) of lower priority on the transmission channel (20), gives precedence over the latter,

wherein the priority sequence of a communications module (18)
comprises logical...

...SPECIFICATION printer 11 executes a process corresponding to the
transferred command information, and if necessary, sends response
information back to the personal computer 10. Therefore, the
personal computer 10 can execute a **remote control** of
the printer 11 and can **monitor** the operation state or the like of
the printer 11 so that a user friendlier print system comfortable to use
can be realized.

Of the **communication modes** defined by IEEE P1284, the
nibble mode realizes information transfer from a peripheral to a host by
using four control signals. Since data signals are...

...SPECIFICATION software architecture.

The hardware modules of the invention are equipped forming groups communicating one other through a connection network, sharing clock and communication resources.

The **communication** between system **modules** is carried out by means of PCM (Pulse Code Modulation) channels and statistical cannels, - there being two **communication links** between each group and the connection network.

These links are bidirectional and, while the statistical ones allow the messages to be transferred between software modes...

...SPECIFICATION parts of the switch to indicate heater settings, motor size, etc for programming chip CU1.

Referring now to FIGS. 11A-11D, the operation of the **communications module** 200 will be described. In particular, there is provided a connector MP2 which represents the first stage of the **input** network 201 for the communications **device** 200.

Connector MP2 is interconnectable with a communications interface CON1 "computer operated network interface" in a **remote personal** computer PC in a manner which will be described hereinafter. Terminal 1 of connector MP2 interconnects with the line designated COMM IN which feeds through the...

...ABSTRACT A1

Apparatus for communication of information from a passive identification module that may be associated with a fluid container and an active **communication module** associated with a fluid delivery **device**. The passive identification module has no **independent** battery or power source but receives its operational energy from an RF signal generated by the active **communication module**. Upon initiation of a fluid delivery transaction a **communication link** is established between the passive identification and active **communication modules** and will proceed only if appropriate authorization is received by the active **communication module** and an associated information storage and retrieval device. Information regarding the fuel delivery transaction may be stored on the storage and retrieval device and may...

NOTE:

...SPECIFICATION module 18 even though it may not be always powered.

If the trailer 14 is a refrigerated trailer, power will be available from the refrigerated unit.

An information and power **input module** is located at the rear of the trailer 14 and communicates with the trailer identification module 18. Information regarding the manifest or cargo to be carried by the trailer 14 can be input via this **communication linkage** which is connected to the RS485 driver 152 of the trailer identification module 18.

A theft prevention function is built in to the trailer identification

...SPECIFICATION portions of the entire braking system are shared, and those portions which are not shared are isolated but interconnected for switching from a primary brake control mode to a backup subsystem upon failure of the primary subsystem. A unique metering spool valve, and the linking of metering spool valves and servocontrol valves with an interlinked tandem selector valve allows for significant reduction in weight and complexity for the subsystem selection device.

Briefly and in general terms, embodiments of the brake valve control system include a brake actuator means in an aircraft wheel braking system, a primary brake valve control...

...SPECIFICATION running a printer and/or any currently unknown or new I/O device. The beginning of the collation record generation, block 336, results in all **communications** between **modules** being done in a manner which is transparent to the central unit, and not along the serial data channel. Handshaking communications take place along the **communication links** 110, 112, 114, and piece record transfer along the links 118, 120 and 122. Errors requiring operator intervention are transmitted to the base **control unit** by means of the multi-drop global serial parallel databus 124, by which background mode communication is maintained between the base unit control 100 and...

...SPECIFICATION of the documents. Since the piece record is dynamic, it
can include data for running a printer and/or any currently unknown or
new I/O **device**. The **beginning** of the collation **record**
generation, block 336, results in all **communications** between
modules being done in a manner which is transparent to the base
unit control, and not along the serial data channel. Handshaking
communications take place along the **communication links** 109,
112, 114, Fig. 5. Errors requiring operator intervention are transmitted
to the base **control unit** by means of the multi-drop
global serial parallel databus 124, by which background mode
communication is maintained between the base **unit control** 100
and each of the respective modules. Thus, transfer of a large volume
information is possible because processing is in parallel in each module
and...

...of the collation record is the activation of the motor drive in the first feed module, block 338. In block 340, the module then scans for the **control** signal for data which is to **control** the operation of the **individual** feeder. This data may include a number of specific documents for a run, the **number of** individual documents which may be included from that specific feeder, particular documents which will be required for an insert operation, and, in the case of **downstream modules**, information regarding the receipt of specific information from upstream modules. This data may be provided from a **control** document, read optically **or by** bar code, or by **input on the module** keyboard, may be transmitted from the base **unit control**, or may be sent as part of a data link communication from a remote source. The three options are illustrated as side paths, block 342...

...ABSTRACT A1

The present invention utilizes hardware and/or software, in combination with a personal computer and its peripheral devices (i.e., storage media, peripheral **control**, video display and the like) to **monitor communication links**. The personal computer, to operate properly, must operate in an interactive **communication mode**. But, to avoid "lock-up" of a **communication link** which is being monitored, the personal computer must be "invisible" to equipment on the **communication link**. Hardware is disclosed which permits the personal computer to operate in its interactive **communications mode** while being "invisible" (non-interactive) to equipment on a **communication link** being monitored.

...SPECIFICATION speech channel, the apparatus waits for a user's response operation (step 1109).

When the user depressed the off-hook key or the "SEND" key, **communication link** is established (**step** 1110). When communication is completed, the reception mode of the speech channel is canceled (step 1107) and the transmission function is disabled (step 1108). When a ringing signal is received during communication, **the** apparatus waits **again** for the user's response operation (step 1109).

When fading occurs for a predetermined period of time or longer in the speech channel reception mode (step 1106), the acknowledge signal sending **state** (step 1104) or a communication enable state (step 1110), the transmission function is disabled (step 1108).

When the transmission function is disabled (step 1108), initialization is resumed (step 1102...

...SPECIFICATION of the motor 70, drive units 72 or both, including their respective home positions, and for sensing respective positions of the mailpieces contents in their **path of** travel, a multiplicity of the sensors 60 are operatively associated on a one-for-one basis with the respective motors 70 and drive units 72, and with the feed path of the mailpiece contents, for sensing such **positions**. The **sensors** 60 are suitably coupled to the control structure 54 for providing data signals representative of **such** positions to the **control** structure 54, and the control structure 54 is conventionally constructed and arranged for operating the motors 70, and drive units 72 for controlling the feeder...

...and extractor 66 in accordance with operator input signals from the interface 56 or from the external source communicating with the module 50 via the **communication** link 58.

The apparatus 10 (Fig. 2(a)) may additionally include one or more applications software carrying modules, represented by the module 80, one or more storage media modules, represented by the module 90, and one or more **communications** link **modules**, represented by the module 100. Each of the applications software modules 80 is a conventional **device**, such as a tape, disk or word processor, and may include control structure 82, preferably including a microprocessor. The control structure 82 is constructed and arranged for controlling the various structures...located with respect to the stationery items feed path, for sensing the presense or absence of stationery items 161 in the feeding structures 170, 175, **180 and** 185 and at various relevant positions in the feed path, and providing conventional input signals to the control structure 162 which are indicative of such...
...190 and drive units 192 for sensing various positions of the motors 190 and drive units 192, including their respective home positions, and providing conventional **input** signals to the **control** structure 162 which are indicative of **such** positions. Further, the

control structure 162 is adapted to provide data signals, such as the signals 166A, corresponding to the aforesaid conditions and positions to the operator interface 164 and to the **communication link** 165 to facilitate operation of the module 160 from the interface 164 or from an external source, such as the computer 120 via the communications ...same purposes hereinbefore discussed in connection with the discussion of the printing module 200. In addition, the accounting module 260 is preferably provided with a **two-way communication link** 266 for interfacing the module 260 with an external **device**, preferably the computer 120, for operation of the module 260 from the computer 120 rather than from the operator interface 264. On the other hand the control structure 262 is also preferably provided with a conventional two-way serial or parallel **communications link** 268 for **interfacing** the control structures 262 and 202 with each other, to permit the operator of the printing module 200 to control operation of the accounting module...

...204 and to permit the computer 120 to control operation of the accounting module via the printing modules control structure 202. Further, the two way **communication link** 266 may be connected via a conventional telephone link to a privately controlled mailing center such as Manifest Mail Reporting System (MMRS) center of the...270B sealed and delivered to the Postal Service.

Referring again to the printing module 200 (Fig. 2(d)), and assuming the stationery items 161 from the printing module 200 are to be automatically processed by inserter structure, such stationery items 161, including one or more sheets and an envelope, are fed one at a time to an inserting module such as the inserting module 350. The inserting module 350 is preferably a conventional standalone **device** which includes suitable **control** structure 352 for controlling the various structures and functions of the module 350. In addition, the module 350 includes an operator interface 354, which is...

...response to operator input signals from the interface 354. The control structure 352 is also conventionally adapted to include a two-way serial or parallel **communication link** 355, for conventionally coupling the control structure 352 to an external source, exemplified by the computer 120, for transmitting data signals, such as the signal... include the capability of printing graphic information including postage indicia, the postage may be printed on the cover envelope after being processed by the inserting **module** 350. Or, assuming the postage for a given letter was not provided in advance of processing by the insertion module 350, or a given business mailer already has apparatus...

...meter, and does not wish to acquire the more complex printing module 200 hereinbefore discussed, the apparatus 10 (Fig. 2(d)) may include one or **more weighing modules** and a conventional postage metering module to which letters 378 from the inserting module 350 are successively fed.

For weighing the letters 378 (Fig. 2(d)), the apparatus 10 may include one or more **weighing** modules 400. The weighing module 400 is preferably a conventional standalone **device** which includes suitable **control** structure 402 for controlling the various structures and functions of the module 400. In addition, the module 400 includes an operator interface 404, which is...

...SPECIFICATION units of different switching modules. In the present

example, 64 of the 256 time slots on each incoming and outgoing link connected to the odd **input** and output **ports** of TMS 2010 are collectively used as a packet channel between **communication interface** 1900 and TMS 2010. The 64 time slots, referred to herein as the packet time slots, each include 12 bits of a packet. Thus the bit rate of the packet channel on incoming link 15 to input port IP1 and the packet channel on outgoing **link** 13 from output port OP1 is 6.144 megabits per second. The single packet channel between a switching module and TMS 2010 is used to...

...ABSTRACT in electrical operating systems. The UCM 10 includes a microprocessor and memory, by virtue of which it becomes tailored to the characteristics of a given **device** 32 to be **controlled** upon plug-in of the UCM into a bussed rack associated with a **Communication Module** 26 preprogrammed with the set values for the drive. A basic control system includes corresponding Electrical Interface Modules 30 and their associated **Communication Module** 36 interconnected via a serial data **communication link** 38 extending between the respective **Communication Modules** for the UCMs and EIMs. As an option, an associated UCM and EIM can be directly connected via parallel leads 40 for direct **control** of a drive unit.

Where appropriate, the basic system is incorporated with a plurality of other basic systems in a second level control system, accessed by a Programmable Logic...

Detailed Description

Detailed Description

... load cells 310, which are amplified and filtered by the signal conditioning unit 371. The other

19

module converts signals sent from the motor drive controller 382.

These signals monitor the drive system and alert the operator should a system fault occur.

The analog output module 378 converts digital signals from the CPU to analog signals. These signals control the motor drive controller 382. The DC input module 373 detects the presence of signal voltage, and is used to monitor the functions of the motor drive controller 382. The relay control module 377 sends power to the pneumatic solenoids 379 which control the air cylinders applying the load to the test wheels. The communication link module 385 provides a serial network connection with the laptop CPU 372. This allows the laptop to control the PLC CPU 374 for setup and data...

Detailed Description

... diagram of a control device for a
5 ventilator according to the invention. In this block diagram
numeral 1 indicates a processor module including a **control**
unit 2 and a memory 3. A high-voltage AC source 4 is
connected to processor module 1, which connects said voltage
source to ventilator 5, The **control unit** furthermore receives
10 high-voltage current from voltage source 4 after said voltage
has been converted by suitable means into low-voltage direct
current. Furthermore a **communication link** 12 is connected to
processor module 1, which **communication link** connects
processor **module** 1 to a central processing unit 6. Also a
15 temperature sensor 7, a potentiometer 8 and a sensor 9 for
measuring the air flow...

Claim

... at least one ventilator which
5 is coupled to an electromotor comprising at least one
excitation winding, which is connected to a voltage source
via a **control unit**, whereby said **control unit**
includes a
processor module comprising a digital computing circuit and
at least one memory for storing control software and control
10 quantities, which processor module includes communication
means for exchanging data between said processor module and a
remote central processing unit via a **communication link**,
characterized in that besides **communication** means the
processor **module** of the aforesaid ventilator also includes
15 connections for connecting sensors associated with said
ventilator for measuring process quantities, such as the
rotational speed, the...

...that said processor module is arranged in such a
manner that in case of failure of said central processing
20 unit and/or of said **communication link** said processor
module
will control said ventilator on the basis of the process
quantities measured by the sensors associated with said
ventilator,
2* A ventilation system according to...

...which ventilator
comprises a fan coupled to an electromotor comprising at
least one excitation winding, which is connected to a voltage

10 source via a **control** unit, whereby said **control unit**
includes
a processor module comprising a **control** circuit and at least
one memory for storing control software and control
quantities, and which processor module includes communication
means for exchanging data between said processor module and a
15 remote central processing unit via a **communication link**,

Detailed Description

... the operating status are recorded in the RAM for use in performing the control algorithm.

In the particular type of burner installations involved here, a **communication** module or gateway may have a number of burner controllers connected to it. The communication module receives commands and requests directed to each of the burner 1 5 controllers from a central **computer**, typically a small desktop unit, and relays these to the specified controller. The communication **module** also provides status information received from the individual controllers to the **central computer** for display to the operator. The **communication module** is connected to a data port of the **central computer** either directly or via a modem link. The **communication module** thus functions as a bi-directional multiplexer which provides status information from the several controllers forming 9 status sources to the **central computer**, and then routes commands and requests from the **central computer** to the controllers.

In either the directly connected or modem-connected case, the **central computer** may be located at some distance from the actual burner installation. This provides safety for the operator and security for the control system by avoiding...

- * Heightened flexibility

Communication Architecture

The Honeywell interface to the Measurex DIALOG is accomplished
through the **Communication Link Module**
developed for Measurex, and
includes:

- * User data base
- * User program
- * Communication firmware
- * Gauging system interface device

Complementing the CLM, the Measurex **Communication Module**
provides a:

- * Distributed **control** system interface **device**
- * DIALOG Data Directory handler to simplify link configuration
- * Multiple high-speed serial links to ensure response and
redundancy for critical control data.

The communication architecture...

Assignee name & address:

Original Abstracts:

...as core temperature, ECG electrodes for providing an electrocardiogram and blood oximetry sensors. The patient monitor is small and compact and easily worn by the **patient** during his normal at **home** activities. To provide communication with a caregiver via a remote **controller** at the caregiver's location, a communications unit is disposed in the facility. The communications unit may be selectively coupled to the programmable patient monitor for receiving, storing and transmitting to the **remote controller patient** physiological condition data and for transmitting instructions from the **remote controller** to the programmable **patient monitor**. When the patient connects the patient monitor to the communications unit, the patient can communicate with the caregiver at the remote location.

Claims:

...physiological condition data representative thereof and being electrically coupled to the programmable patient monitor; and a communications unit disposed in the facility for communicating with a remote **controller**, and selectively coupled to the programmable **patient monitor** for receiving, storing and transmitting to the **remote controller patient** physiological condition data and for transmitting instructions from the **remote controller** to the programmable **patient monitor**; wherein the **programmable patient monitor** monitors the recorded physiological condition data in accordance with a stored instruction comprising a predetermined range of values and generates a patient alarm signal in response to a monitored physiological condition data being outside the predetermined range; wherein the alarm signal is resettable only upon receipt of a new instruction from the remote **controller**; wherein the programmable **patient monitor** monitors operation of the plurality of **patient** monitoring sensors within a predetermined **set of** operational values and generates an alert signal in response to a detected operation outside the predetermined set; wherein the alert signal is resettable upon the...

Remote monitoring system e.g. for diabetes, asthma **patients**, has
remote apparatus generating **patient**'s response for queries sent
by central computer system based on patient's input through input buttons

Alerting Abstract ...NOVELTY - A central computer system transmits script
program with queries and response choices to modem in **patient**'s
remote apparatus (26). The apparatus (26) receives **patient**'s
response for the queries through input buttons (70A-70D) arranged adjacent
to display (64). A processor executes the script program to display queries
and...

...to display queries and response choices, input command to receive
responses and transmit comment to transmit patient's responses to the
central computer system. The **input unit** inputs the set of
queries to be answered by the patient and corresponding response choices. A
database is connected to the script generator and **input unit**
for storing the script program and responses. The remote apparatus receives
script programs and transmits responses to the central computer system
through a communication network. The response **unit** has **input**
buttons corresponding to response choices, arranged adjacent to the display
...

...An INDEPENDENT CLAIM is also included for **remote** monitoring method
of **patients**.

...

...USE - **Remote** monitoring system establishes communication between
patients and health care providers through telephone network, for
continuously monitoring health status of patients having diabetes, asthma,
hypertension, cardiovascular disease, eating disorders, HIV, mental health

Remote monitoring and management of **patient** health e.g. diabetic patient, involves downloading script program from web server, in palmtop computer of patient and processing it to obtain instructions

Alerting Abstract USE - For **remotely** monitoring blood glucose level in diabetic **patients**, weight level of obesity patients, blood pressure monitoring in health care industry. Also for pharmaceutical manufacturers for clinical development and post marketing surveillance of new...

...surveillance and monitoring of other disease conditions, for monitoring in ventony of home stationed health supply e.g. for delivery of oxygen tank to COPD **patients**, for **remote** education over Internet, online surveillance of individuals on probation or parole by law enforcement officers, and for collecting data from smart appliances such as identification...

...monitor and manage a health condition of a patient. The system includes a health care provider apparatus operated by a health care provider and a **remotely** programmable **patient** apparatus that is operated by a patient. The health care provider develops a script program using the health care provider apparatus and then sends the script program to a

remotely programmable patient apparatus through a communication network such as the World Wide Web. The script program is a computer-executable patient protocol that provides information to the...

...health condition by asking the patient questions and by receiving answers to those questions. The answers to these health related questions are then forwarded as patient data from the remotely programmable patient apparatus to the health care provider apparatus through the communication network. The patient data may also include information supplied by a physiological monitoring device such as a blood glucose monitor that is connected to the remotely programmable patient apparatus. When the patient data arrives at the health care provider apparatus, the patient data is processed for further management of the patient's health condition by the health care provider, such as forwarding another script program to the remotely programmable patient apparatus.

Claims:

...to the health care provider, the health care provider apparatus, comprising: i). a health care provider interaction unit having: A). a health care provider interaction unit display that is controlled by a health care provider interaction unit interface, the health care provider interaction unit interface accepting a health care provider display information and rendering the health care provider display information for display on the health care provider interaction unit display; B). a health care provider interaction unit input device that receives a health care provider input from the health care provider, the health care provider interaction unit input device sending the health care provider input to the health care provider interaction interface; ii). a health care provider data management unit, comprising: A). a health care provider central processing unit having...

...program having script commands representing a computer-executable patient protocol for the management and monitoring of the patient's health condition; c). providing a remotely-programmable patient apparatus to the patient, the remotely-programmable patient apparatus, comprising: i). a patient interaction unit having: A). a patient interaction unit display that is controlled by a patient interaction unit interface, the patient interaction unit interface accepting a patient display information and rendering the patient display information for display on the patient interaction unit display; B). a patient interaction unit input device that receives a patient data from the patient, the patient interaction unit input device sending the patient data to the patient interaction unit interface; ii). a patient data management unit, comprising: A). a patient central processing unit having a ...

...processing unit; d). connecting the health care provider apparatus to the communication network by way of the health care provider communication means; e). connecting the remotely programmable patient apparatus to the communication network by way of the patient communication means; f). downloading the script program from the health care provider apparatus to the remotely programmable patient apparatus over the communication network; g). processing the script program with the patient central processing means of the remotely programmable

patient apparatus, the processing of the script program producing the patient display information;h). displaying the patient display information to the patient on the patient interaction...

Alerting Abstract ...NOVELTY - The apparatus (1) has an interface unit to input signal from a switch. Data, like heart-rate and electro cardiograph are transmitted from the apparatus at patient's side to a distant medical system or vice versa through an antenna (4) in a belt (3) and are received by a transceiver and indicated by audio unit ...

...USE - For in-house medicine for patients at distant remote areas from hospitals...

...reach the patient. Because of the message back facility, if the patient

is unconscious, a third person can treat him in case of emergencies at **remote** places. The **patient** need not visit a hospital regularly. Communication through satellites is also possible. DESCRIPTION OF DRAWING(S) - The figure shows the 3D view of the portable...

Assignee name & address:

Original Abstracts:

A medical apparatus is provided with a programmable medical device disposed at a first room location and a remote monitor and/or controller disposed at a second room location. The programmable medical device is used to administer a medical treatment to a patient, and the remote monitor/controller may be used to monitor the operation of the medical device, control the operation of the medical device, and/or to transfer data from the medical device to the remote monitor/controller. The apparatus may allow voice communication between the remote monitor/controller and the patient who is receiving treatment via the medical device while the medical device is being monitored and/or controlled from the remote location. The remote monitor/controller may also include means for determining the type of medical device to which it is connected.

Claims:

...said pump signal is generated; a controller for controlling said pumping mechanism; and memory means for storing data regarding said liquid medicant administered to said patient; a remote monitor for monitoring said liquid medicant administered to said patient, said remote monitor being disposed at a second room location remote from said first room location; and means for transferring said data from said infusion pump to said remote monitor effective for transferring said data real-time while said infusion pump is administering said liquid medicant to said patient and for generating a transfer interrupt when said data is to be transferred; wherein said controller responds to said interrupts in accordance with predetermined priorities...

DOCUMENT TYPE: Patent

RECORD TYPE: Abstract

LANGUAGE: English

FILE SEGMENT: Metadex; Mechanical & Transportation Engineering Abstracts;

ANTE: Abstracts in New Technologies and Engineering; Aerospace & High
 Technology

ABSTRACT:

... a manual input means and output display means for selective
 communication with the other remotes under control of the loop controller.
 The display means includes **individual** status lamps for each
~~remote~~ as well as common display means selectively related to any one
 of the remotes. A plurality of loop system **controllers** connected to a
 central processing **unit** provide expanded capabilities.

DESCRIPTORS: Frames; **Communication** systems; Generators; **Modules**

; Messages; Serials; Failure; Synchronism; Computer programs; Commands;
 Lamps; Control systems; Stations; Consoles; Central processing units;
 Breaking; United States; Operators; Synchronization
